

AI Engineer Test Tasks

Hi there! Welcome to the AI Engineer Test Task! We're excited to see what we can create together.

Test Task

Our creative strategist reviews video ads daily on Dropbox Replay, leaving timestamped feedback for video editors.

The comments are repetitive - same hook issues, pacing notes, CTA placement. We want to test whether Gemini's video understanding can take a first pass on this feedback so the strategist only needs to refine. And your task is to build a tool to help with that:

What to Build

A simple internal web tool with:

1. Video upload
2. Timestamped comments - click the timeline to leave a comment at a specific second
3. Chat panel with Gemini that:
 - Sees the actual video content
 - Sees all existing comments left by user or by LLM and their timestamps
 - Responds to prompts like "what are the top 3 issues?", "is the hook working?", "what would you say about 0:08?"
 - When asked, can post comments directly into the timeline at specific timestamps

Scope and Constraints

- Single page. No auth, no multi-user, no polished UI.
- Any stack you want.
- Gemini must actually see the video frames (not thumbnails or transcripts). Use Gemini's File API or equivalent.
- Time budget: 1–3 days of focused work. Don't over-engineer.

What We Provide

- 3 sample video ads from our brands
- ~15 real comments from our strategist on past ads - so you can see the tone, depth, and patterns we're after
- Gemini API key (we cover the cost)
- HERE - <https://replay.dropbox.com/share-folder/YrKEVlxfK0zmflhZ>

How We Evaluate

- Does it work? We test it on the sample videos.
- Is the AI output close to what a real strategist would write? Compared against the sample comments.
- Product sense. Bonus signal: ask us questions about the use case before you start building.

Deliverables

- Working code (GitHub repo or zip)
- A 15–20 minute Loom covering:
- Demo of the tool
- Your prompt design and reasoning

Payment and Logistics

- €300 flat fee, paid via Wise/Revolut within 5 days of submission, regardless of outcome.
- Submit within 7 days of accepting the task.
- IP: code and prompts you write for this task become ours.
- We will give you written technical feedback within 3 business days of submission, whether or not we move forward.
